Setting Up a Zoho Creator Account

Exploring the Platform Architecture and Interface

Prepared By	PRAJESH P
Department	CSBS
Roll Number	241401067

241401067

1. Introduction

Zoho Creator is a low-code application development platform that enables users to build, deploy, and manage custom business applications without extensive programming knowledge. This document records the process of setting up a Zoho Creator account and provides a walkthrough of the platform's interface and modules, based on a series of screenshots captured during exploration of the Creator dashboard. Each screenshot is presented along with a brief description of the corresponding module and its purpose within the platform.

2. Objective

The primary objective of this exercise is to gain hands-on familiarity with the Zoho Creator platform by creating a trial account, exploring its low-code development environment, and understanding how the various modules of the console — spanning application development, deployment, and organization-wide management — work together. Specific goals include:

- Successfully sign up for a Zoho Creator trial account and create a sample application.
- Navigate through the DEVELOP, DEPLOY, and MANAGE sections of the console to understand their respective roles.
- Identify the purpose of each module — Applications, Microservices, Environments, Mobile, Portal, Users, Organization, Governance, Metrics, Operations, and Billing.
- Document the overall platform architecture through annotated screenshots for future reference and academic reporting.

241401067

3. Steps Followed During Account Setup

Step	Action Performed
1	Visited the Zoho Creator website and registered for a free trial account using an organizational email address.
2	Logged in to the Creator console and viewed the 'Applications' dashboard, where a sample application named 'wisapp' was created.
3	Explored the 'Microservices' module to understand modular, AI-ready integration components.
4	Reviewed the 'Environments' page to understand the Stage-to-Production deployment workflow.
5	Checked the 'Mobile' and 'Portal' sections to understand external distribution and self-service access options.
6	Navigated to 'Organization' to review company profile, branding, and preference settings.
7	Explored 'Governance' to understand available security policy and authentication configurations.
8	Reviewed 'Metrics', 'Operations', and 'Billing' to understand analytics, administrative controls, and subscription management.

4. Platform / System Architecture

The Zoho Creator interface is organized into two primary functional groups, visible consistently in the left-hand navigation panel across all screens:

Category	Modules	Purpose
DEVELOP	Applications, Microservices	Build and manage applications; create modular microservices for third-party integrations and AI features.
DEPLOY	Environments, Mobile, Portal	Manage Stage/Production environments, distribute mobile apps, and provide a self-service portal for external users.
MANAGE	Users, Organization, Governance, Metrics, Operations, Billing	Administer user access, organization profile, security policies, usage analytics, operational settings, and subscription/billing details.

Together, these three layers form the overall architecture of the Creator console: applications and microservices are first **developed**, then **deployed** across environments and channels, and finally **managed** centrally for security, monitoring, operations, and billing. The diagram below presents this structure visually, showing how each module maps to its parent category and how the three categories connect to form a continuous application lifecycle.

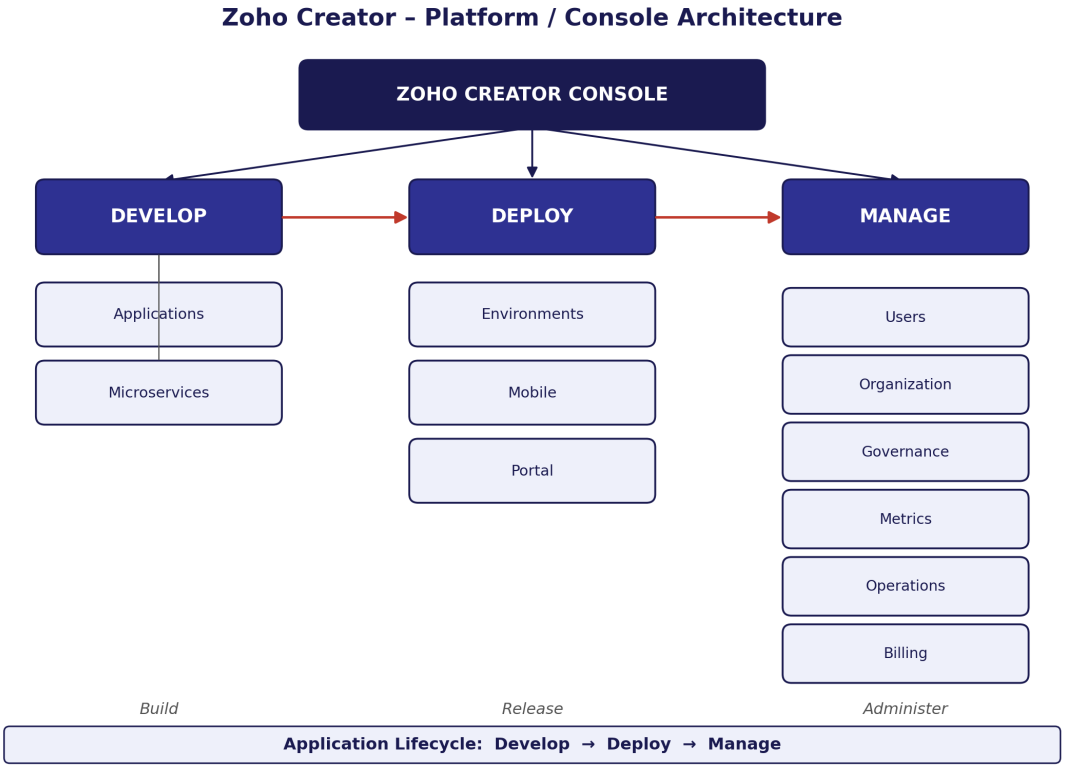

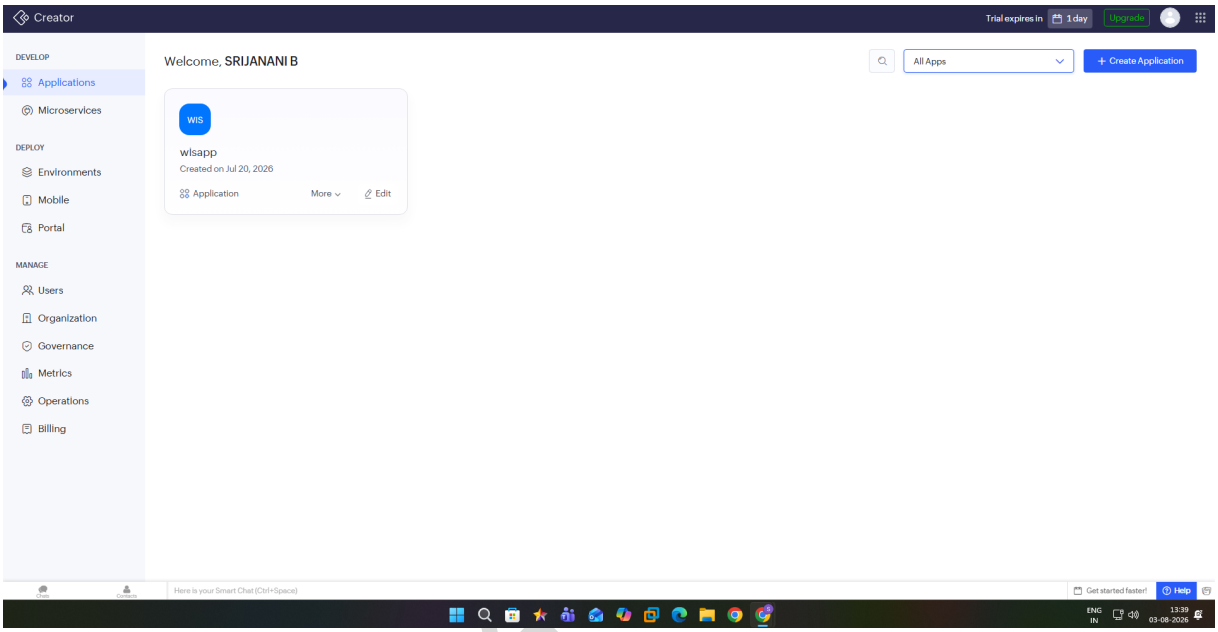

Figure A: Zoho Creator platform architecture — Develop, Deploy, Manage layers and their constituent modules.

5. Screenshot Walkthrough

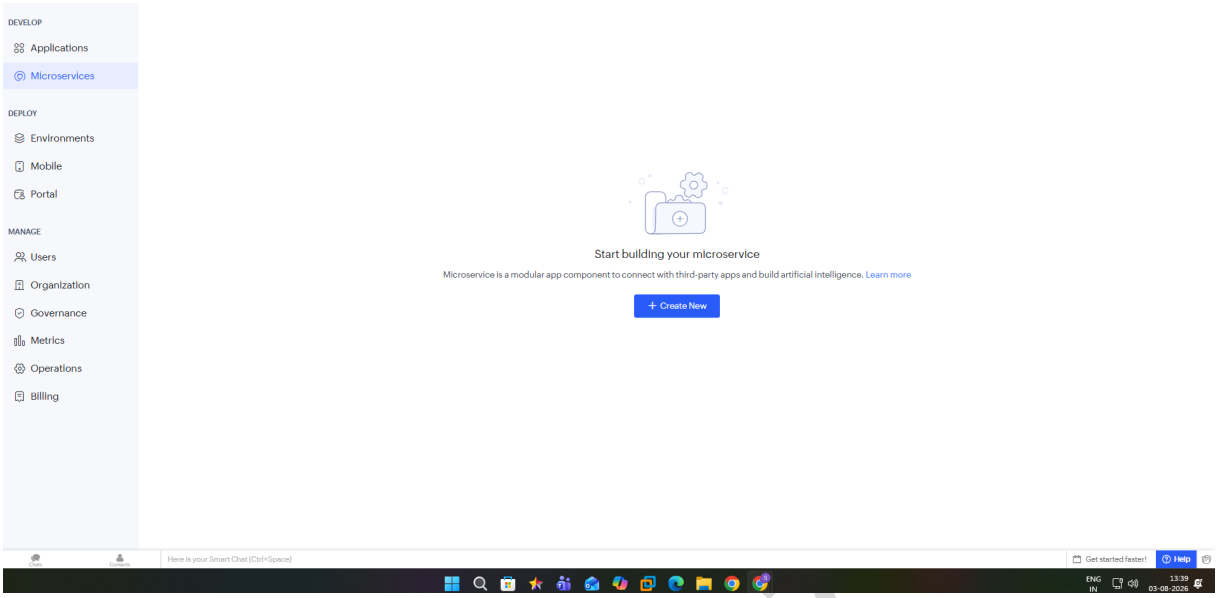

This section presents a detailed, screen-by-screen walkthrough of the Zoho Creator console explored during account setup. Each figure is accompanied by a descriptive title and an in-depth explanation of the interface elements, their function, and their role within the platform's overall DEVELOP – DEPLOY – MANAGE architecture described in the previous section.

Figure 1: Applications Dashboard

This is the landing page of Zoho Creator's 'Applications' section, the very first screen a developer sees after logging in. It welcomes the user by name ('Welcome, SRIJANANI B') and displays the newly created sample application named 'wisapp', created on Jul 20, 2026, represented as a card with its initials ('WIS') as an auto-generated icon, along with quick action links for Application, More, and Edit. The top-right corner provides a search bar, an 'All Apps' filter drop-down, and a prominent '+ Create Application' button for starting new projects. The top navigation bar also displays the account's trial status ('Trial expires in 1 day') and an 'Upgrade' button, reminding the user of the account's current plan limits. Most importantly, the left-hand navigation panel is visible here and remains consistent throughout the console; it is organized into three logical groups — DEVELOP (Applications, Microservices), DEPLOY (Environments, Mobile, Portal), and MANAGE (Users, Organization, Governance, Metrics, Operations, Billing) — which together define the overall architecture of the platform and form the backbone of this report.

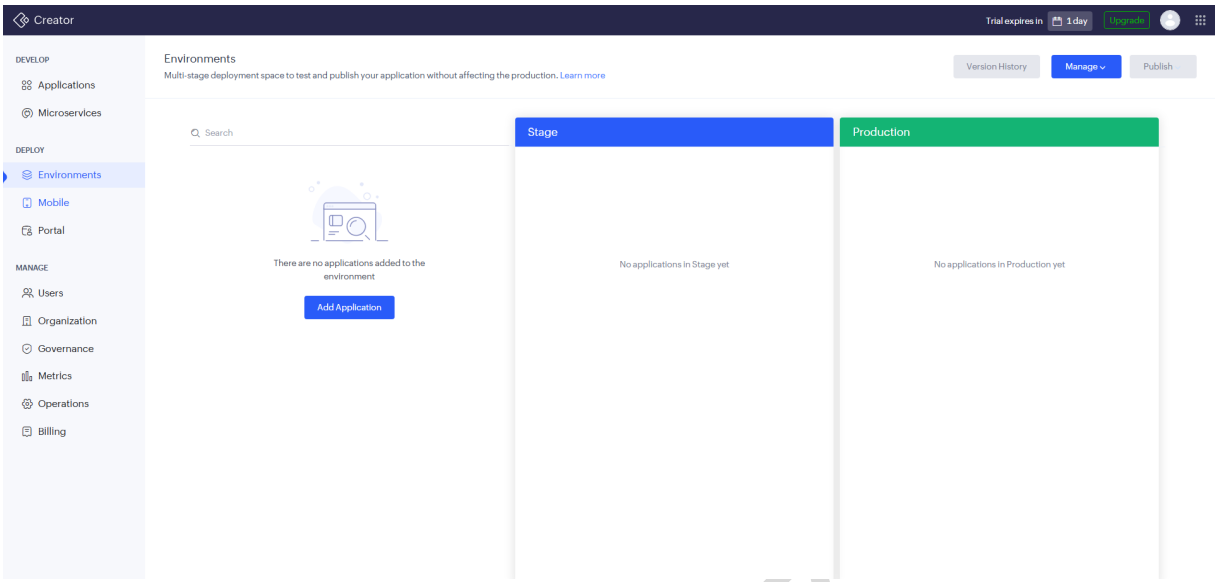

Figure 2: Microservices Panel

This screen shows the 'Microservices' module, the second item under the DEVELOP category. Since no microservice has yet been created in this trial account, the platform displays a friendly, illustrated empty state accompanied by the heading 'Start building your microservice' and a short explanatory line: 'Microservice is a modular app component to connect with third-party apps and build artificial intelligence,' along with a 'Learn more' hyperlink for further documentation. A large blue '+ Create New' button invites the user to begin building one. Conceptually, microservices allow a Creator application to be broken down into small, independent, reusable functional units — for example, a dedicated service for payment validation or an AI-based recommendation engine — that can be plugged into one or more applications without duplicating logic, thereby improving modularity and maintainability of the overall system.

241401067

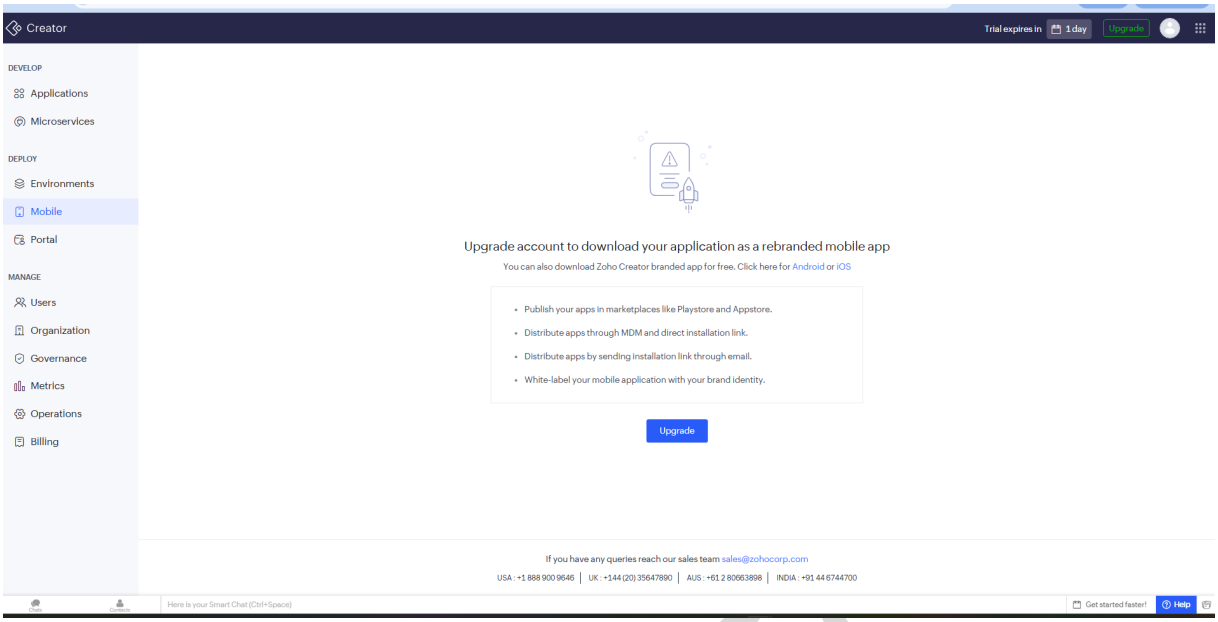

Figure 3: Environments Setup

This screenshot displays the 'Environments' page under DEPLOY, which provides a multi-stage deployment space to test and publish an application without affecting the live production system, as stated directly on the page. The screen is split into two clearly labelled columns — a blue 'Stage' column and a green 'Production' column — visually reinforcing the separation between the testing and live environments. Since no application has yet been added to either stage, both columns show 'No applications in Stage/Production yet,' along with a central 'Add Application' button and a search bar to locate applications once they exist. Additional controls in the top-right corner — 'Version History', 'Manage', and 'Publish' — indicate that this page is also where version control and the actual go-live (publish) action would be performed, making Environments the central hub for controlled, staged software releases.

241401067

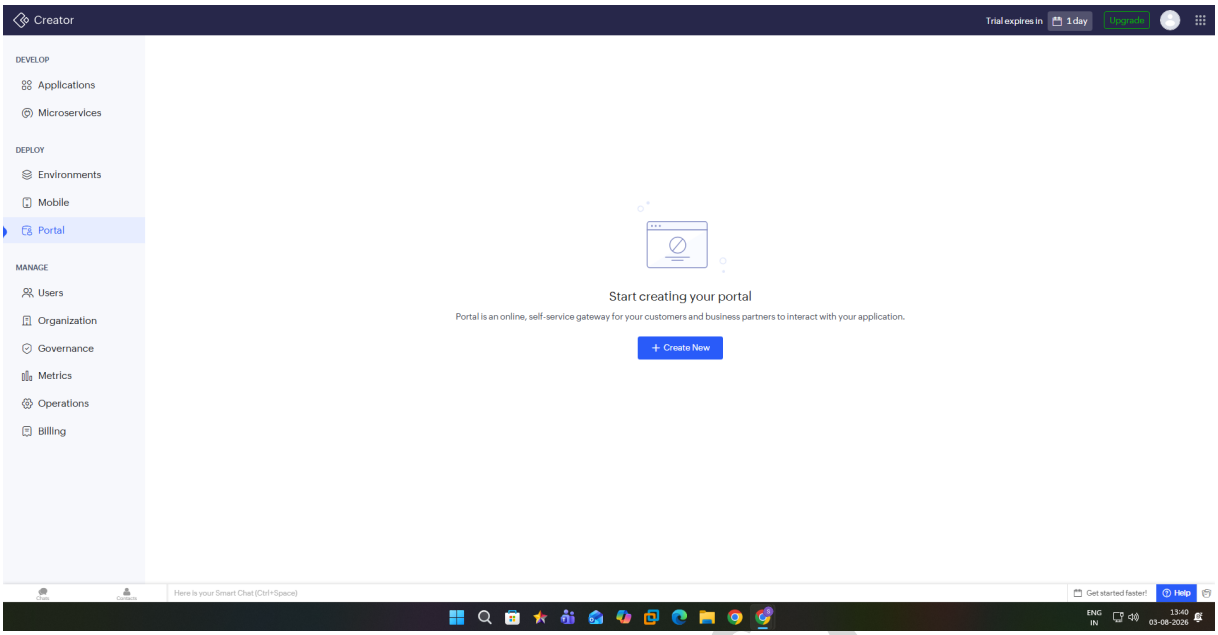

Figure 4: Mobile App Distribution

This page corresponds to the 'Mobile' section under DEPLOY, and it focuses on how a Creator application can be delivered to end users as a native mobile experience. Because the current account is on a trial plan, the page displays an upgrade prompt: 'Upgrade account to download your application as a rebranded mobile app,' while also clarifying that the free, Zoho-branded Creator app can still be downloaded for Android or iOS at no cost. A bulleted list outlines the advanced capabilities unlocked after upgrading — publishing apps on marketplaces such as the Play Store and App Store, distributing apps through Mobile Device Management (MDM) or direct installation links, sending installation links via email, and fully white-labelling the mobile application with the organization's own brand identity. Contact details for the sales team (email and region-specific phone numbers for USA, UK, Australia, and India) are also provided at the bottom for users wishing to upgrade.

241401067

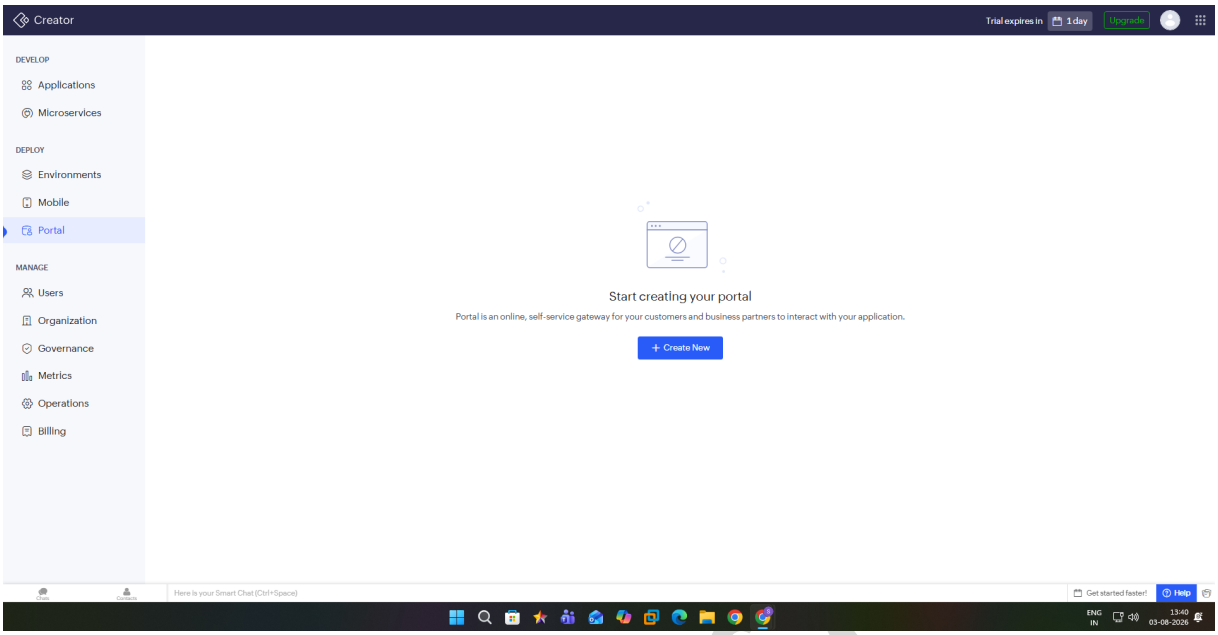

Figure 5: Portal – Empty State (Initial View)

This screenshot captures the 'Portal' section under DEPLOY in its default empty state. The page explains that a 'Portal is an online, self-service gateway for your customers and business partners to interact with your application,' positioning it as a distinct, external-facing deployment channel separate from the internal Stage and Production environments seen earlier. As no portal exists yet in this account, the interface shows an illustrated placeholder graphic along with a heading 'Start creating your portal' and a '+ Create New' button to begin the setup process. Portals are typically used when an organization wants to expose specific forms, reports, or workflows to people outside the core team — such as clients submitting requests or vendors updating records — without granting them full internal access to the application.

241401067

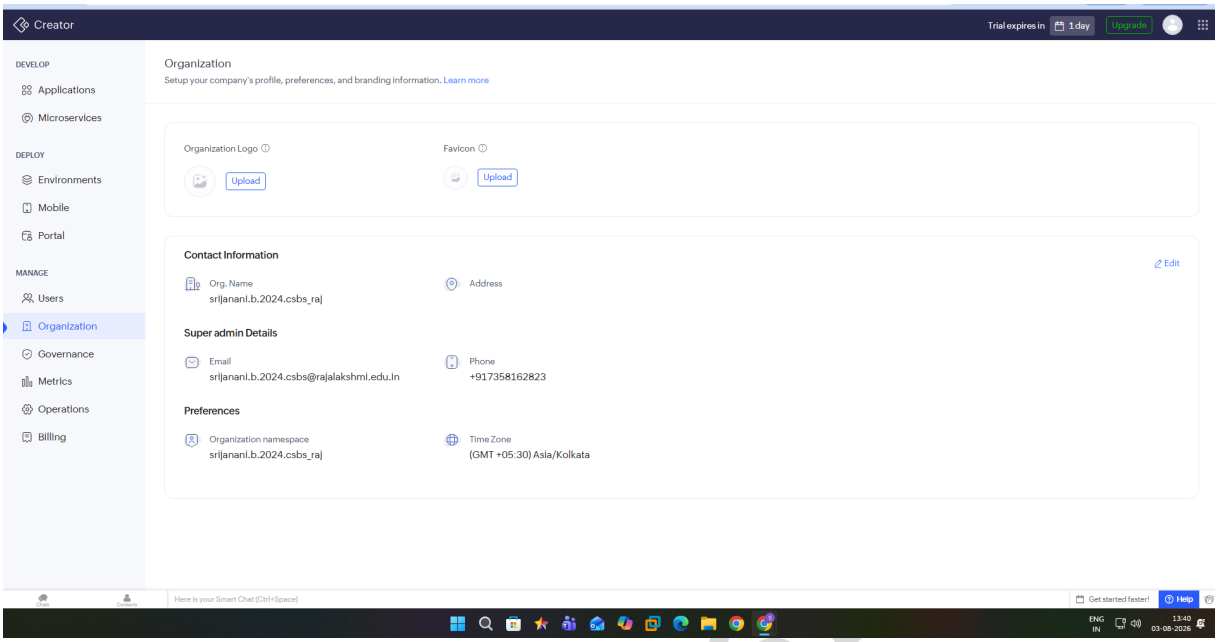

Figure 6: Portal – Empty State (Confirmed View)

This is a second, corroborating view of the same 'Portal' page, captured to confirm that the state and options remain consistent on revisiting the module. It reiterates that Portal functions as a controlled, self-service access point for external stakeholders such as customers and business partners, distinct from the developer- and admin-facing sections of the console. The repeated screenshot validates that the 'Create New' workflow is the consistent entry point for provisioning a portal, and reinforces Portal's role as the third and final pillar of the DEPLOY category, alongside Environments and Mobile, in delivering the completed application to its intended audience.

241401067

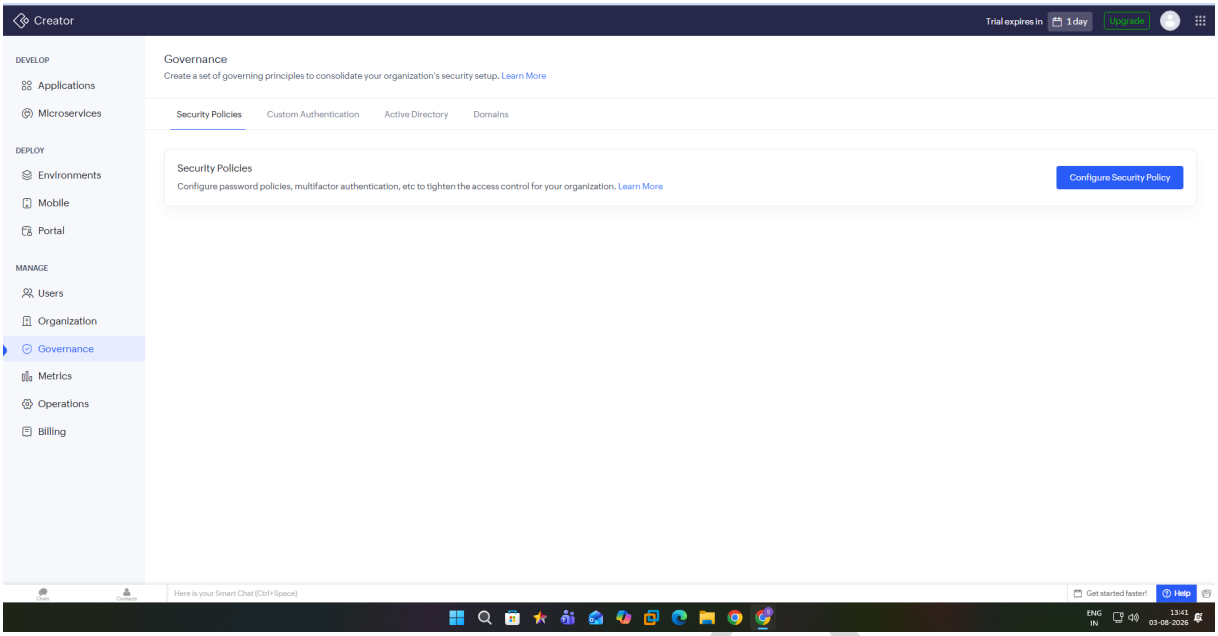

Figure 7: Organization Settings

This screen displays the 'Organization' page under MANAGE, which centralizes the company's profile, branding, and preference configuration in one place, as summarized by the page description: 'Setup your company's profile, preferences, and branding information.' At the top, the page allows uploading an Organization Logo and a Favicon, both of which are currently unset placeholders in this trial account. Below that, the 'Contact Information' card lists the registered Org. Name (srijanani.b.2024.csbs_raj) along with an editable Address field. The 'Super Admin Details' section shows the administrator's registered email (srijanani.b.2024.csbs@rajalakshmi.edu.in) and phone number, confirming account ownership. Finally, the 'Preferences' section records the Organization namespace (used to uniquely identify the org in URLs) and the configured Time Zone, set to (GMT +05:30) Asia/Kolkata, ensuring that all timestamps and scheduled actions across the platform align with Indian Standard Time.

241401067

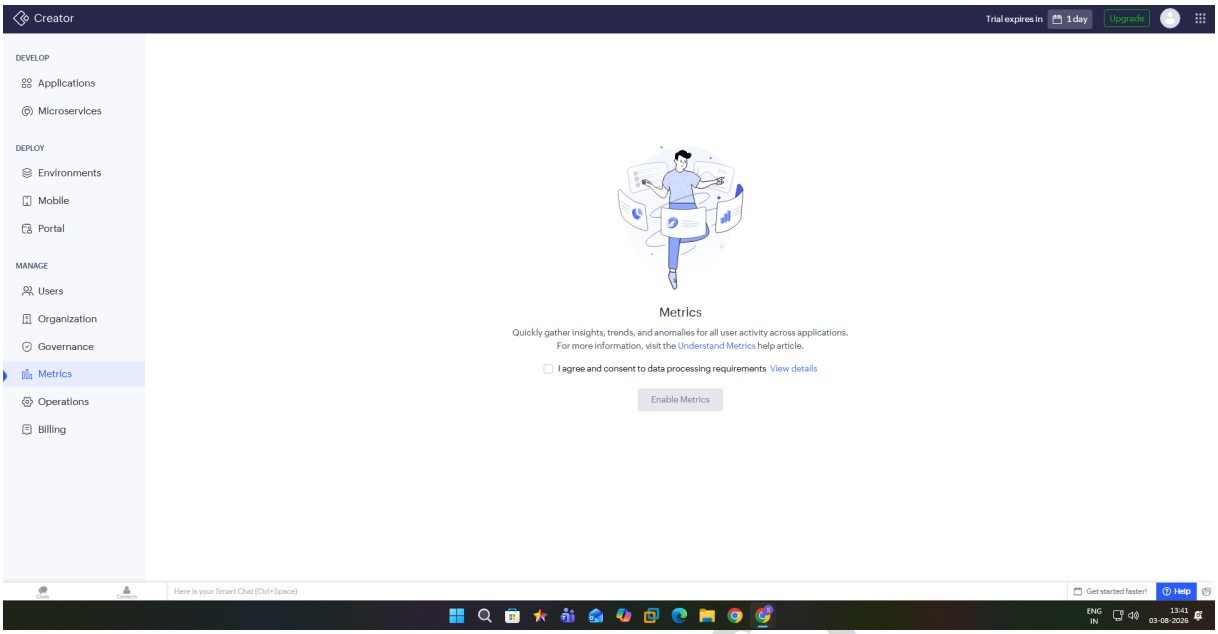

Figure 8: Governance – Security Policies

This is the 'Governance' page under MANAGE, described on-screen as a space to 'Create a set of governing principles to consolidate your organization's security setup.' The page is organized into four tabs — Security Policies, Custom Authentication, Active Directory, and Domains — of which 'Security Policies' is currently active. This tab allows the organization to configure password policies and multi-factor authentication (MFA) in order to tighten access control for all users, accessible via the blue 'Configure Security Policy' button. The presence of the remaining tabs indicates that the platform also supports integrating external identity providers (Custom Authentication and Active Directory) and restricting sign-ups or logins to verified organizational email domains (Domains), together forming a comprehensive identity and access-governance layer for the account.

241401067

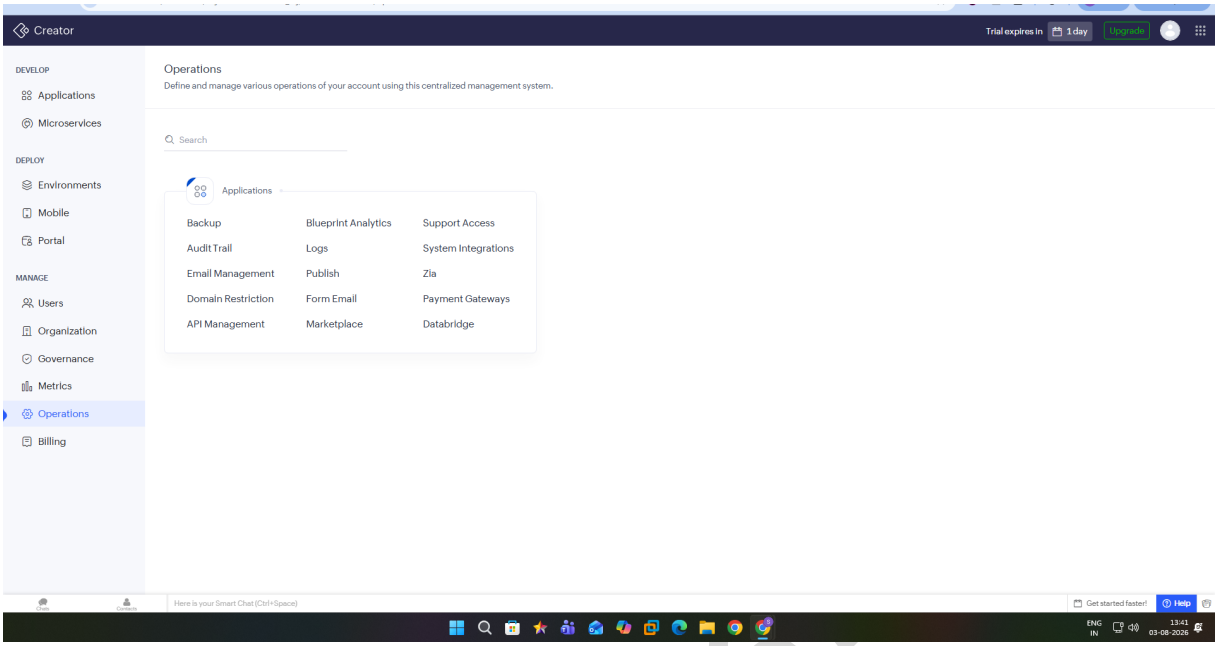

Figure 9: Metrics Overview

This screenshot shows the 'Metrics' page under MANAGE, introduced with the tagline: 'Quickly gather insights, trends, and anomalies for all user activity across applications,' along with a link to the 'Understand Metrics' help article for further reading. Before this feature can be activated, Zoho Creator requires the user to explicitly agree to a data-processing consent checkbox ('I agree and consent to data processing requirements'), reflecting the platform's adherence to data-privacy regulations; a 'View details' link is provided to review exactly what data is processed. Only after this checkbox is ticked does the greyed-out 'Enable Metrics' button become active. Once enabled, this module would typically surface usage statistics, behavioural trends, and unusual activity patterns across all applications built within the organization, supporting data-driven decisions about application performance and user engagement.

241401067

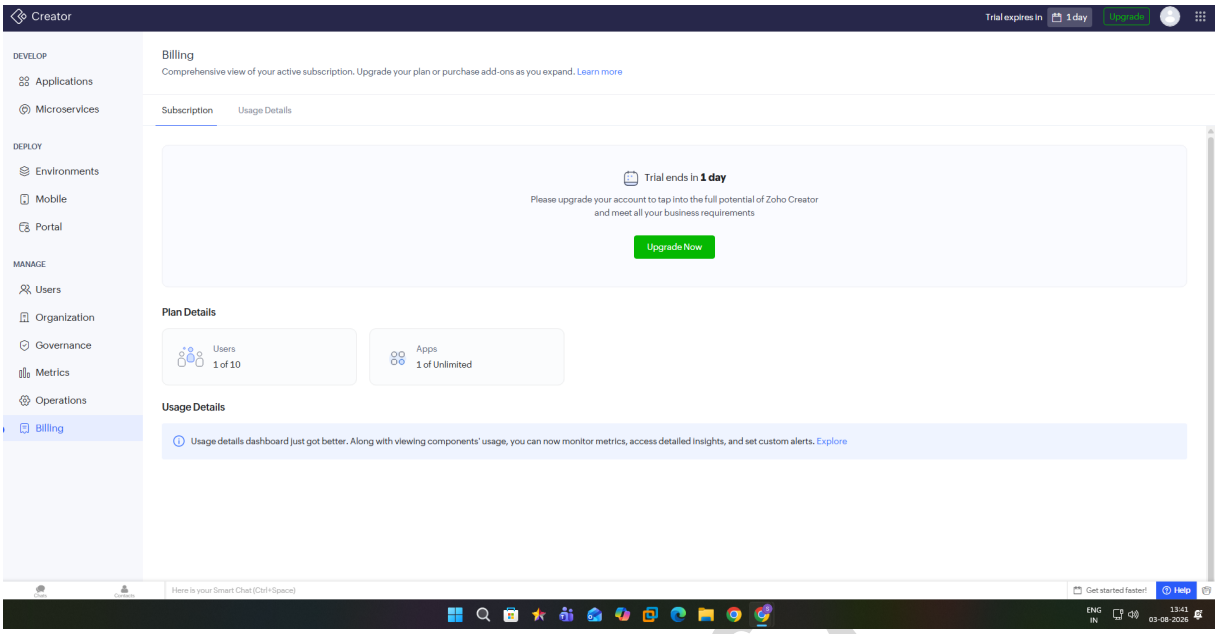

Figure 10: Operations Console

This page represents the 'Operations' section under MANAGE, described as a centralized system to 'define and manage various operations of your account.' It is organized as a searchable grid of administrative modules grouped under 'Applications', including: Backup (for scheduled data backups), Audit Trail (for tracking user and system actions), Email Management, Domain Restriction, API Management (for managing API keys and access), Blueprint Analytics (for monitoring automated business-process flows), Logs, Publish, Form Email, Marketplace (for third-party extensions), Support Access, System Integrations, Zia (Zoho's built-in AI assistant), and Payment Gateways and Databridge for financial and data-exchange integrations. Collectively, this dense grid illustrates just how many operational and governance levers an administrator has at their disposal, positioning Operations as the most feature-rich hub within the MANAGE category.

241401067

Figure 11: Billing and Subscription

This final screenshot shows the 'Billing' page under MANAGE, described as offering a 'Comprehensive view of your active subscription,' with options to upgrade the plan or purchase add-ons as usage grows. The 'Subscription' tab (active here, alongside a separate 'Usage Details' tab) prominently displays a countdown banner — 'Trial ends in 1 day' — paired with a green 'Upgrade Now' call-to-action button, creating urgency for the user to convert to a paid plan. Below this, the 'Plan Details' cards summarize current consumption against trial limits: 1 of 10 permitted Users and 1 of Unlimited Apps, showing that the account is well within its allotted quota. An additional informational banner announces that the 'Usage Details' dashboard has been enhanced to allow monitoring of component-level metrics, detailed insights, and custom alerts, with an 'Explore' link for further investigation — rounding off the MANAGE category by tying application usage directly back to account billing and plan management.

241401067

6. Key Observations and Learning Outcomes

Through this exploration of the Zoho Creator trial account, several important observations were made regarding the design and capability of the platform:

- **Unified Console Design:** All development, deployment, and management functions are accessible from a single, consistently structured left-navigation panel, which reduces the learning curve for new users.
- **Separation of Environments:** The clear division between 'Stage' and 'Production' environments encourages safe testing practices before an application is released to end users.
- **Multi-Channel Deployment:** Applications built on the platform can be delivered through multiple channels — web, rebranded mobile apps, and self-service portals — without requiring separate development effort.
- **Built-in Governance and Security:** Dedicated modules for Governance (security policies, authentication, domains) and Metrics indicate that the platform is designed with enterprise-grade security and monitoring in mind.
- **Centralized Administration:** The Operations module consolidates a large number of administrative capabilities (backup, audit trail, API management, payment gateways, etc.), highlighting the platform's scalability for real-world business use.
- **Trial Limitations:** Several features, such as rebranded mobile apps and metrics, require an account upgrade, which is clearly communicated to the user through prompts on the relevant pages.

7. Conclusion

The screenshots and observations captured in this report collectively demonstrate the end-to-end structure of the Zoho Creator console — from application development and microservice creation, through deployment across environments, mobile, and portal channels, to organization-wide management covering governance, metrics, operations, and billing. This walkthrough provides a clear understanding of how the platform is architected to support the full low-code application lifecycle within a single, unified interface, and establishes a solid foundation for further hands-on development on Zoho Creator.
