EXPERIMENT 07

Integrating a Zoho Creator Application with Another Zoho Service Using Connections and API

Patient Appointment Scheduling System — Zoho Calendar Integration Use Case

PRAJESH P

1. Aim

To integrate the Patient Appointment Scheduling System built in Zoho Creator with Zoho Calendar — by creating an authorised connection and calling the Zoho Calendar API through a Deluge script in a workflow — so that an event is added to the calendar the moment a patient submits the Patient Profile form with consent.

This removes the need for front-desk staff to enter every appointment into the calendar by hand, keeping the schedule consistent with the data captured in the application.

2. Procedure

Step 1: Open Microservices — From the Develop section of the Zoho Creator workspace, the Microservices page was opened. Microservices are modular components used to connect with third-party apps; Create New was selected.

Step 2: Choose Connections — In the Create New Microservice dialog (AI Models, AR Library, Connections, Datasources, Custom API), Connections — "Connect apps with third-party services" — was selected using Pick & Create.

Step 3: Configure the Zoho Calendar connection — In the Zoho Calendar – Add Connection form, the Connection Name was set to zoho_calendar_connection, Authorization Access to Administrators only, Connection Mode to Quick connect (Zoho credential), and the credentials were enabled for All Actions. The connection was then submitted with Create And Authorize.

Step 4: Authorise Creator — On the consent screen, Creator requested access to Calendar operations (add calendar, add event, get calendar and event details, free/busy, search events, update calendar and event). The consent checkbox was ticked and Accept was clicked.

Step 5: Enable the connection for the application — In the connection's Connection Access panel the link name was zoho_calendar_connection1, with permissions Create Calendar, Create Event and Get all Calendar. Access was switched On for Patient Appointment Scheduling System and left Off for the other app.

Step 6: Create the workflow — A new workflow named Sync_Appointment_To_Zoho_Calendar was created on the Patient Profile form, with Record Event set to Created and Form Event set to Successful form submission.

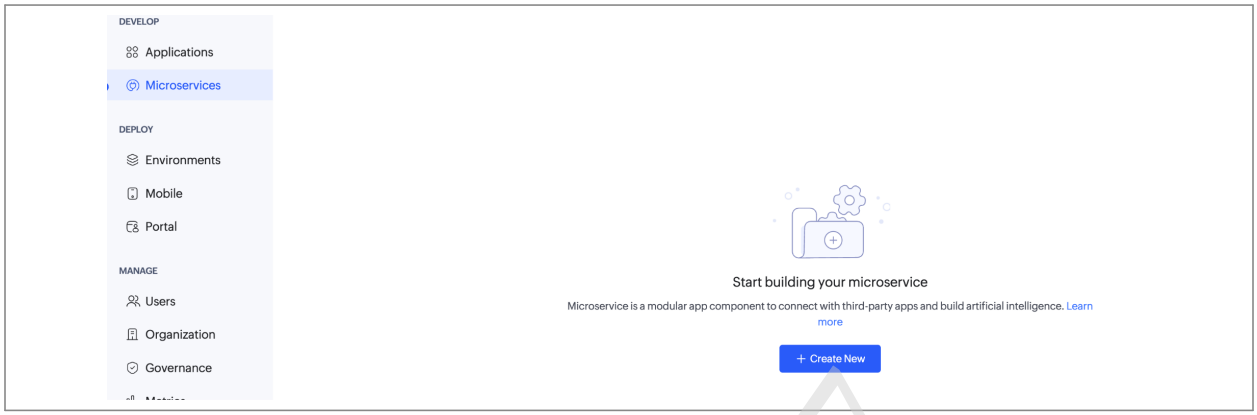

Step 7: Write the Deluge script — A Deluge action was added. If consent_for_treatment is true, the script formats the preferred date (yyyyMMdd) and time (colons removed), builds the start value with the +0530 offset, fills a dateandtime map (timezone Asia/Calcutta), creates the event title "Patient Appointment - <patient name>", and calls zoho.calendar.createEvent with the calendar ID, the event map and the connection link name zoho_calendar_connection1. The API response is shown using info.

Step 8: Save the action — The script was saved with Update, attaching it under Patient Profile › Created › Successful form submission › Sync_Appointment_To_Zoho_Calendar, so that it runs on every valid new submission.

3. Output

3.1 Opening the Microservices section

The Microservices page, reached from the Develop menu, is empty and offers Create New to start building a microservice for connecting with third-party apps.

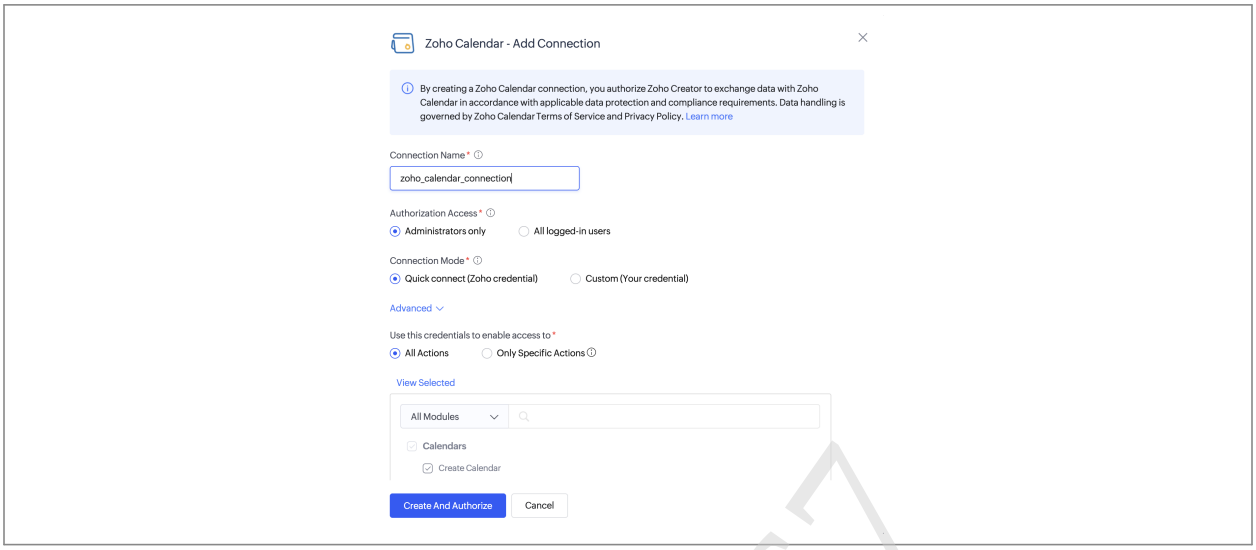

3.2 Choosing the Connections microservice

The Create New Microservice dialog lists AI Models, AR Library, Connections, Datasources and Custom API. Connections is highlighted because it links the application to an external Zoho service.

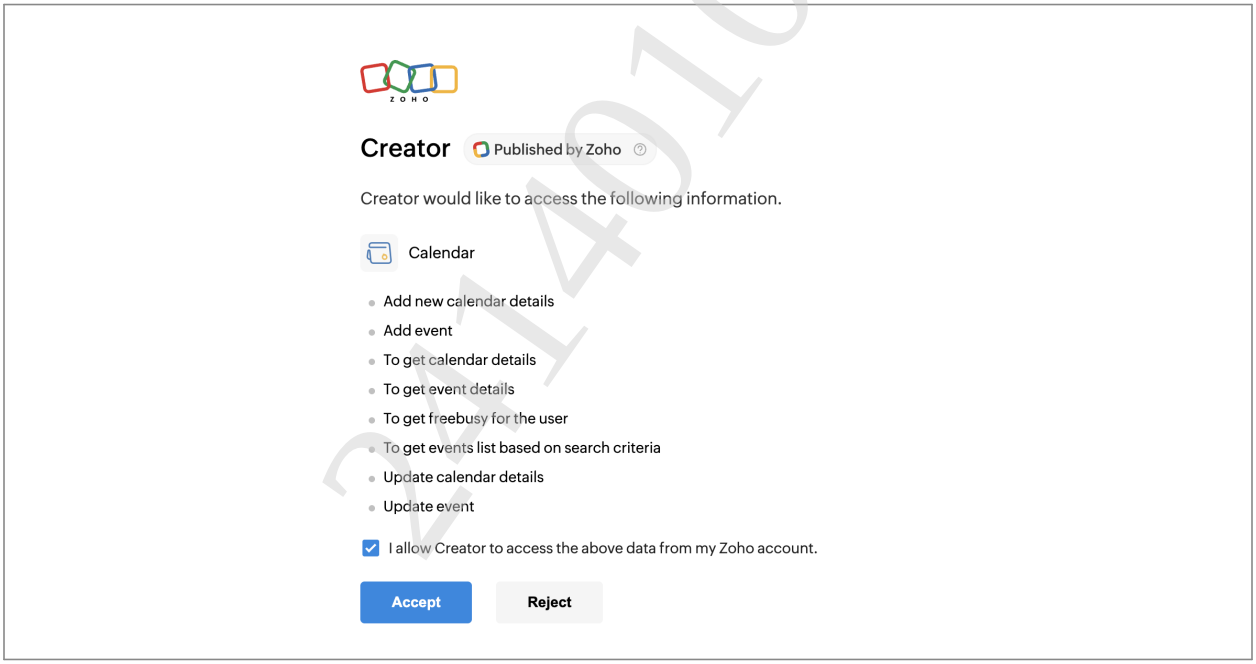

24401067

3.3 Adding the Zoho Calendar connection

The Add Connection form shows the connection name zoho_calendar_connection, Administrators-only access, Quick connect mode and All Actions enabled, ready for Create And Authorize.

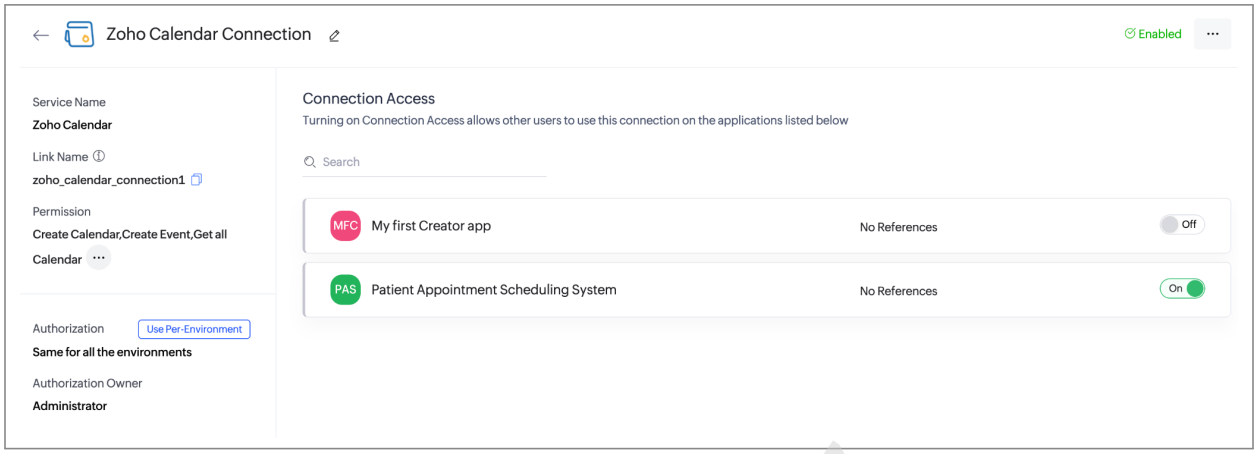

3.4 Authorising Creator to access Zoho Calendar

The consent screen lists the Calendar operations Creator will be allowed to perform. Accepting it completes the authorisation of the connection.

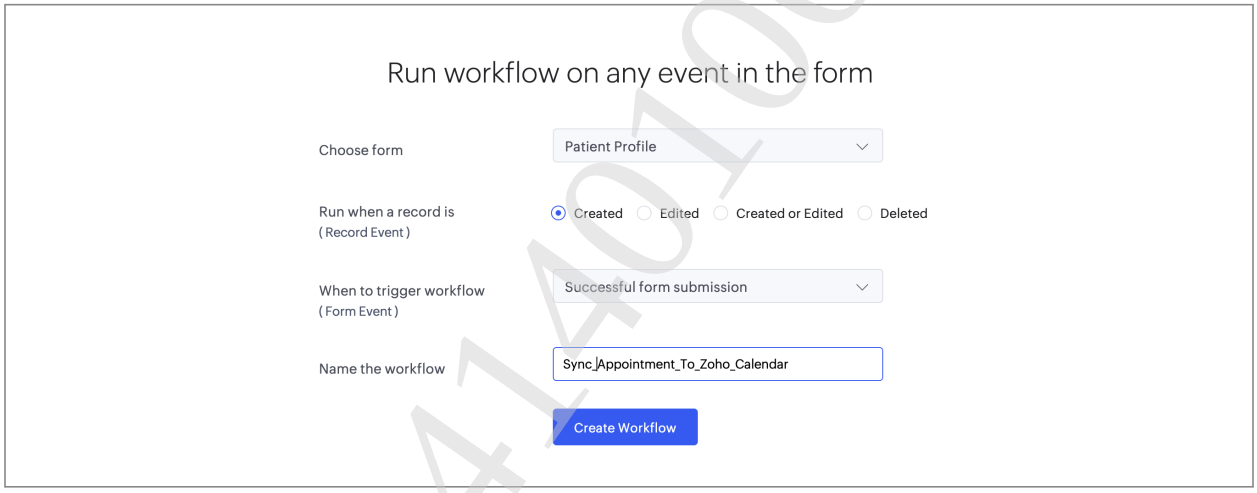

2140107

3.5 Connection details and access

The saved connection shows Service Name Zoho Calendar, link name zoho_calendar_connection1 and permissions Create Calendar, Create Event and Get all Calendar. Access is On for Patient Appointment Scheduling System, so its Deluge scripts can use the connection.

3.6 Creating the workflow

The new-workflow screen shows the form Patient Profile, Record Event Created, Form Event Successful form submission, and the workflow name Sync_Appointment_To_Zoho_Calendar.

3.7 Deluge script calling the Zoho Calendar API

The Deluge editor shows the script. It runs only when consent_for_treatment is true, converts the preferred date and time into the required start format, builds the event maps, and creates the event with zoho.calendar.createEvent using the connection zoho_calendar_connection1.

4. Final Result

A connection to Zoho Calendar was created, authorised and enabled for the Patient Appointment Scheduling System, and a workflow on the Patient Profile form was built that uses it through a Deluge script and the Zoho Calendar API.

On every successful new submission with consent given, the workflow builds the event start time from the preferred appointment date and time (Asia/Calcutta, +0530), titles it “Patient Appointment - <patient name>” and creates it in Zoho Calendar without manual entry by the front desk.

The exercise met its objective: a Zoho Creator application was integrated with another Zoho service using connections and an API call from Deluge, so appointment data now flows automatically into the calendar.
